Professional coffee mill with stainless steel body.

The grinders are conical, in hardened, tempered steel, to guarantee a long working life and excellent performance over time.

Unlike flat grinders, the conical type allow coffee to be ground to exactly the right particle size.

The powerful motor is equipped with a reduction system allowing the speed to be cut from 10,200 to 800 RPM.

A low milling speed is very important since it ensures the coffee is not overheated, leading to a burnt flavour.

The possibility to adjust the degree of grinding is important and essential for obtaining a good creamy coffee.

The LUX is designed to maintain the coffee's quality and aroma intact.

the automatic brewing switch allows you to brew only the coffee you need and avoid waste.

To clean the coffee grinder Lux, we recommend using a normal cloth dampened with water.
